1. Claims 1-11 and 23-25 have been elected for examination and Claims 12-22 and 26-29 have been canceled.
2. The abstract of the disclosure is objected to because the current abstract does not adequately describe the inventive feature of the claimed invention. Correction is required. See MPEP § 608.01(b).

All amended abstracts are to be submitted on a **separate sheet** (without the brackets and underlines) in addition to a mark-up copy.

3. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(a) the invention was known or used by others in this country, or patented or described in a printed publication in this or a foreign country, before the invention thereof by the applicant for a patent.

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

4. Claims 1-11 and 23-25 are rejected under 35 U.S.C. 102(b) as being anticipated by Baker, U.S. Patent No. 5,996,032.

Baker teaches the invention as claimed including a method comprising:

(a) substantially simultaneously reading values from a plurality of registers (col. 2, line 39; each bit in a multi-bit register addressable separately constitute a separate single bit register, col. 3, line 20),

(b) parsing a particular instruction, and determining a select number of values in the select number of registers (selected for modification; col. 2, line 38),

(c) modifying a subset of values in the select number of registers (col. 2, line 40),

(d) substantially simultaneously writing the values to the plurality of registers (col. 2, line 40, and

further teaches as in claims 2-22,

(e) wherein entire set of values are collectively read and written by instructions that operate on the entire set of values (entire set can be modified) – claim 2,

(f) wherein the plurality of registers are predicate registers or NaT registers (can be any number and any type of registers) – claims 2, 3, 10, and 11,

(g) wherein the instruction is an Itanium instruction selecting up to 63 register to be modified (can be any type of instruction modifying any number of registers) – claims 5-9.

The program product claims 23-25 are equivalently rejected based on the same reason.

5. Claims 1-11 and 23-25 are rejected under 35 U.S.C. 102(b) as being anticipated by Song et al, U.S. Patent No. 5,991,531.

Song et al teaches the invention as claimed including a method comprising:

- (a) substantially simultaneously reading values from a plurality of registers (col. 3, line 30; a vector register is equivalent to a plurality of registers),
- (b) parsing a particular instruction, and determining a select number of values in the select number of registers (col. 3, line 30),
- (c) modifying a subset of values in the select number of registers (col. 5, line 17),
- (d) substantially simultaneously writing the values to the plurality of registers (col. 3, line 32), and

further teaches as in claims 2-22,

- (e) wherein entire set of values are collectively read and written by instructions that operate on the entire set of values (conventional operation of vector instructions) – claim 2,
- (f) wherein the plurality of registers are predicate registers or NaT registers (can be any number and any type of registers) – claims 2, 3, 10, and 11,
- (g) wherein the instruction is an Itanium instruction selecting up to 63 register to be modified (can be any type of instruction modifying any number of registers) – claims 5-9.

The program product claims 23-25 are equivalently rejected based on the same reason.
